NONLINEAR ELLIPTIC EQUATIONS ON CARNOT GROUPS

MASSIMILIANO FERRARA, G. MOLICA BISCI, AND DUŠAN REPOVŠ

ABSTRACT. This article concerns a class of elliptic equations on Carnot groups depending on one real positive parameter and involving a subcritical nonlinearity (for the critical case we refer to G. Molica Bisci and D. Repovš, *Yamabe-type equations on Carnot groups*, Potential Anal. 46:2 (2017), 369-383). As a special case of our results we prove the existence of at least one nontrivial solution for a subelliptic equation defined on a smooth and bounded domain D of the Heisenberg group $\mathbb{H}^n = \mathbb{C}^n \times \mathbb{R}$. The main approach is based on variational methods.

1. INTRODUCTION

Analysis on Carnot-Carathéodory (briefly CC) spaces is a field currently undergoing great development. These abstract structures are a special class of metric spaces in which the interactions between analytical and geometric tools have been carried out with prosperous results.

In this setting, a fundamental role is played by Carnot groups that, as it is well-known, are finite dimensional, simply connected Lie groups $\mathbb{G}$ whose Lie algebra $\mathfrak{g}$ of left invariant vector fields is stratified (see Section 2). Roughly speaking Carnot groups can be seen as local models of CC spaces. Indeed, they are the natural tangent spaces to CC spaces, exactly as Euclidean spaces are tangent to manifolds.

It is well-known that a great attention has been focused by many authors on the study of subelliptic equations on Carnot groups and in particular, on the Heisenberg group $\mathbb{H}^n$. See, among others, the papers [2, 4, 5, 8, 11, 17], as well as [12, 13] and references therein.

Motivated by this large interest, we study here the existence of weak solutions for the following problem

$$(P_\lambda^f) \quad \begin{cases} -\Delta_{\mathbb{G}} u = \lambda f(\xi, u) & \text{in } D \\ u|_{\partial D} = 0, \end{cases}$$

where D is a smooth bounded domain of the Carnot group $\mathbb{G}$, $\Delta_{\mathbb{G}}$ is the subelliptic Laplacian on $\mathbb{G}$, and λ is a positive real parameter.

Key words and phrases. Subelliptic equation; Carnot group; Weak solution; Critical point result; Heisenberg group; Folland-Stein space.

2010 Mathematics Subject Classification. Primary: 35H20; Secondary: 43A80, 35J70.

Problem (P_λ^f) has a variational nature, hence its weak solutions can be found as critical points of a suitable functional $\mathcal{J}_\lambda$ defined on the Folland-Stein space $S_0^1(D)$, whose analytic construction is recalled in Section 2.

Thanks to this fact, the main approach is based on the direct methods of calculus of variations (see [15]) and on the geometric abstract framework on Carnot groups (see, among others, the classical reference [3] and references therein).

More precisely, under a suitable subcritical growth condition on the nonlinear term f , we are able to prove the existence of at least one (non-trivial) weak solution of problem (P_λ^f) provided that λ belongs to a precise bounded interval of positive parameters.

The main novelty of this new framework is that, instead of the usual assumptions on functionals, it requires some hypotheses on the nonlinearity, which allow for better understanding of the existence phenomena. This allows us to enlarge the set of applications of the direct minimization exploiting this abstract method without any asymptotic condition of the term f at zero, as requested in [8, Theorem 3.1].

A special case of our result in the Heisenberg setting reads as follows.

Theorem 1.1. *Let D be a smooth and bounded domain of the Heisenberg group $\mathbb{H}^n$ and let $f : \mathbb{R} \rightarrow \mathbb{R}$ be a continuous function such that*

$$(1) \quad \sup_{t \in \mathbb{R}} \frac{|f(t)|}{1 + |t|^p} \leq \kappa,$$

where $p \in (1, \gamma 2_h^* - 1)$, with $\gamma \in (2/2_h^*, 1)$ and $2_h^* := 2 \left(\frac{n+1}{n} \right)$. Assume that

$$(2) \quad 0 < \kappa < \frac{(p-1)^{\frac{p-1}{p}}}{\frac{p-1}{p} \frac{p+1}{p}} |D|^{\frac{1-\gamma}{p} + \frac{(1-p)(\gamma 2_h^* - 1)}{p \gamma 2_h^*}},$$

where $c_{1,\gamma}$ and $c_{2,\gamma}$ denote the embedding constants of the Folland-Stein space $\mathbb{H}_0^1(D)$ in $L^{\gamma 2_h^*}(D)$ and $L^{\frac{p+1}{\gamma}}(D)$, respectively.

Then the following subelliptic problem

$$(P_\kappa) \quad \begin{cases} -\Delta_{\mathbb{H}^n} u = f(u) & \text{in } D \\ u|_{\partial D} = 0, \end{cases}$$

has a weak solution $u_{0,\kappa} \in \mathbb{H}_0^1(D)$ such that

$$\|u_{0,\kappa}\|_{\mathbb{H}_0^1(D)} < \left(\kappa p \kappa_{2,\gamma}^{p+1} |D|^{1-\gamma} \right)^{\frac{1}{1-p}}.$$

For the sake of completeness we recall that very recently in [14], the existence of multiple solutions for parametric elliptic equations on Carnot groups has been proved by exploiting the celebrated Ambrosetti-Rabinowitz condition and a local minimum result due to Ricceri (see [18]). We emphasize that in the present paper we do not require such technical assumption for

the nonlinear term f . Moreover, the results obtained here are completely different from the one contained in [16], where critical subelliptic problems on Carnot groups was studied.

The plan of the paper is as follows. Section 2 is devoted to our abstract framework and preliminaries. Next, in Section 3, Theorem 3.1 and some preparatory results (see Lemmas 3.2 and 3.3) are presented. In the last section, Theorem 3.1 is proved.

2. THE ABSTRACT FRAMEWORK

In this section we briefly recall some basic facts on Carnot groups and the functional space $S_0^1(D)$.

Dilatations. Let $(\mathbb{R}^n, \circ)$ be a Lie group equipped with a family of group automorphisms, namely *dilatations*, $\mathfrak{F} := \{\delta_\eta\}_{\eta>0}$ such that, for every $\eta > 0$, the map

$$\delta_\eta : \prod_{k=1}^r \mathbb{R}^{n_k} \rightarrow \prod_{k=1}^r \mathbb{R}^{n_k}$$

is given by

$$\delta_\eta(\xi^{(1)}, \dots, \xi^{(r)}) := (\eta \xi^{(1)}, \eta^2 \xi^{(2)}, \dots, \eta^r \xi^{(r)}),$$

where $\xi^{(k)} \in \mathbb{R}^{n_k}$ for every $k \in \{1, \dots, r\}$ and $\sum_{k=1}^r n_k = n$.

Homogeneous dimension. The structure $\mathbb{G} := (\mathbb{R}^n, \circ, \mathfrak{F})$ is called a *homogeneous* group with *homogeneous dimension*

$$(3) \quad \dim_h \mathbb{G} := \sum_{k=1}^r k n_k.$$

From now on, we shall assume that $\dim_h \mathbb{G} \geq 3$. We remark that, if $\dim_h \mathbb{G} \leq 3$, then necessarily $\mathbb{G} = (\mathbb{R}^{\dim_h \mathbb{G}}, +)$. Note that the number $\dim_h \mathbb{G}$ is naturally associated to the family $\mathfrak{F}$ since, for every $\eta > 0$, the Jacobian of the map

$$\xi \mapsto \delta_\eta(\xi), \quad \forall \xi \in \mathbb{R}^n$$

equals $\eta^{\dim_h \mathbb{G}}$.

Stratifications. Let $\mathfrak{g}$ be the Lie algebra of left invariant vector fields on $\mathbb{G}$ and assume that $\mathfrak{g}$ is *stratified*, that is:

$$\mathfrak{g} = \bigoplus_{k=1}^r V_k,$$

where the integer r is called the *step* of $\mathbb{G}$, V_k is a linear subspace of $\mathfrak{g}$, for every $k \in \{1, \dots, r\}$, and

$$\begin{aligned} \dim V_k &= n_k, \text{ for every } k \in \{1, \dots, r\}; \\ [V_1, V_k] &= V_{k+1}, \text{ for } 1 \leq k \leq r-1, \text{ and } [V_1, V_r] = \{0\}. \end{aligned}$$

In this setting the symbol $[V_1, V_k]$ denotes the subspace of $\mathfrak{g}$ generated by the commutators $[X, Y]$, where $X \in V_1$ and $Y \in V_k$.

Carnot group and subelliptic Laplacian on $\mathbb{G}$. A *Carnot group* is a homogeneous group $\mathbb{G}$ such that the Lie algebra $\mathfrak{g}$ associated to $\mathbb{G}$ is stratified.

Moreover, the *subelliptic Laplacian* operator on $\mathbb{G}$ is the second-order differential operator, given by

$$\Delta_{\mathbb{G}} := \sum_{k=1}^{n_1} X_k^2,$$

where $\{X_1, \dots, X_{n_1}\}$ is a basis of V_1 . We shall denote by

$$\nabla_{\mathbb{G}} := (X_1, \dots, X_{n_1})$$

the related *horizontal gradient*.

Critical Sobolev inequality. A crucial role in the functional analysis on Carnot groups is played by the following Sobolev-type inequality

$$(4) \quad \int_D |u(\xi)|^{2^*} d\xi \leq C \int_D |\nabla_{\mathbb{G}} u(\xi)|^2 d\xi, \quad \forall u \in C_0^\infty(D)$$

due to Folland (see [6]). In the above expression C is a positive constant (independent of u) and

$$2^* := \frac{2\dim_h \mathbb{G}}{\dim_h \mathbb{G} - 2},$$

is the *critical Sobolev exponent*. Inequality (4) ensures that if D is a bounded open (smooth) subset of $\mathbb{G}$, then the function

$$(5) \quad u \mapsto \|u\|_{S_0^1(D)} := \left(\int_D |\nabla_{\mathbb{G}} u(\xi)|^2 d\xi \right)^{1/2}$$

is a norm in $C_0^\infty(D)$.

Folland-Stein space. We shall denote by $S_0^1(D)$ the *Folland-Stein space* defined as the completion of $C_0^\infty(D)$ with respect to the norm $\|\cdot\|_{S_0^1(D)}$. The exponent 2^* is critical for $\Delta_{\mathbb{G}}$ since, as in the classical Laplacian setting, the embedding $S_0^1(D) \hookrightarrow L^q(D)$ is compact when $1 \leq q < 2^*$, while it is only continuous if $q = 2^*$, see Folland and Stein [7] and the survey paper [10] for related facts.

Heisenberg group. The simplest example of Carnot group is provided by the *Heisenberg group* $\mathbb{H}^n := (\mathbb{R}^{2n+1}, \circ)$, where, for every

$$p := (p_1, \dots, p_{2n}, p_{2n+1}) \text{ and } q := (q_1, \dots, q_{2n}, q_{2n+1}) \in \mathbb{H}^n,$$

the usual group operation $\circ : \mathbb{H}^n \times \mathbb{H}^n \rightarrow \mathbb{H}^n$ is given by

$$p \circ q := \left(p_1 + q_1, \dots, p_{2n} + q_{2n}, p_{2n+1} + q_{2n+1} + \frac{1}{2} \sum_{k=1}^{2n} (p_k q_{k+n} - p_{k+n} q_k) \right)$$

and the family of dilatations has the following form

$$\delta_\eta(p) := (\eta p_1, \dots, \eta p_{2n}, \eta^2 p_{2n+1}), \quad \forall \eta > 0.$$

Thus $\mathbb{H}^n$ is a $(2n+1)$ -dimensional group and by (3) it follows that

$$\dim_h \mathbb{H}^n = 2n + 2,$$

and

$$2_h^* := 2 \left(\frac{n+1}{n} \right).$$

The Lie algebra of left invariant vector fields on $\mathbb{H}^n$ is denoted by $\mathfrak{h}$ and its standard basis is given by

$$\begin{aligned} X_k &:= \partial_k - \frac{p_{n+k}}{2} \partial_{2n+1}, \quad k \in \{1, \dots, n\} \\ Y_k &:= \partial_{n+k} - \frac{p_k}{2} \partial_{2n+1}, \quad k \in \{1, \dots, n\} \\ T &:= \partial_{2n+1}. \end{aligned}$$

In such a case, the only non-trivial commutators relations are

$$[X_k, Y_k] = T, \quad \forall k \in \{1, \dots, n\}.$$

Finally, the stratification of $\mathfrak{h}$ is given by

$$\mathfrak{h} = \text{span}\{X_1, \dots, X_n, Y_1, \dots, Y_n\} \oplus \text{span}\{T\}.$$

We denote by $\mathbb{H}_0^1(D)$ the Folland-Stein space in the Heisenberg group setting, as well as by $\Delta_{\mathbb{H}^n}$ the Kohn-Laplacian operator on $\mathbb{H}^n$.

We cite the monograph [3] for a nice introduction to Carnot groups and [15] for related topics on variational methods used in this paper.

3. THE MAIN RESULT AND PRELIMINARY LEMMAS

The aim of this section is to prove that, under natural assumptions on the nonlinear term f , weak solutions to problem (P_λ^f) below do exist. More precisely, the main result is an existence theorem for equations driven by the subelliptic Laplacian, as stated here below.

Theorem 3.1. *Let D be a smooth and bounded domain of the Carnot group $\mathbb{G}$ of homogeneous dimension $\dim_h \mathbb{G} \geq 3$ and let $f : D \times \mathbb{R} \rightarrow \mathbb{R}$ be a Carathéodory function such that*

$$(6) \quad |f(\xi, t)| \leq \alpha(\xi) + \beta(\xi)|t|^p \text{ almost everywhere in } D \times \mathbb{R},$$

where

$$\alpha \in L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D) \quad \text{and} \quad \beta \in L^{\frac{1}{1-\gamma}}(D)$$

with $\gamma \in (2/2^*, 1)$, $p \in (1, \gamma 2^* - 1)$, and $2^* := \frac{2 \dim_h \mathbb{G}}{\dim_h \mathbb{G} - 3}$. Furthermore, let

$$(7) \quad 0 < \lambda < \frac{(p-1)^{\frac{p-1}{p}}}{p^{\frac{p-1}{p}} \kappa_{1,\gamma}^{\frac{p}{p-1}} \kappa_{2,\gamma}^{\frac{p}{p-1}} \|\alpha\|_{L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D)}^{\frac{p-1}{p}} \|\beta\|_{L^{\frac{1}{1-\gamma}}(D)}^{\frac{1}{p}}},$$

where $\kappa_{1,\gamma}$ and $\kappa_{2,\gamma}$ denote the embedding constants of the Folland-Stein space $S_0^1(D)$ in $L^{\gamma^2}(D)$ and $L^{\frac{p+1}{\gamma}}(D)$, respectively. Then the following subelliptic parametric problem

$$(P_\lambda^f) \quad \begin{cases} -\Delta_{\mathbb{G}} u = \lambda f(\xi, u) & \text{in } D \\ u|_{\partial D} = 0, \end{cases}$$

has a weak solution $u_{0,\lambda} \in S_0^1(D)$ and

$$\|u_{0,\lambda}\|_{S_0^1(D)} < \left(\lambda p \kappa_{2,\gamma}^{p+1} \|\beta\|_{L^{\frac{1}{1-\gamma}}(D)} \right)^{\frac{1}{1-p}}.$$

We recall that a *weak solution* for the problem (P_λ^f) , is a function $u : D \rightarrow \mathbb{R}$ such that

$$\begin{cases} \int_D \langle \nabla_{\mathbb{G}} u(\xi), \nabla_{\mathbb{G}} \varphi(\xi) \rangle d\xi \\ = \lambda \int_D f(\xi, u(\xi)) \varphi(\xi) d\xi, \quad \forall \varphi \in S_0^1(D) \\ u \in S_0^1(D). \end{cases}$$

Let us consider the functional $\mathcal{J}_\lambda : S_0^1(D) \rightarrow \mathbb{R}$ defined by

$$(8) \quad \mathcal{J}_\lambda(u) := \frac{1}{2} \|u\|_{S_0^1(D)}^2 - \lambda \int_D F(\xi, u(\xi)) d\xi, \quad \forall u \in S_0^1(D)$$

where $\lambda \in \mathbb{R}$ and, as usual, we set $F(\xi, t) := \int_0^t f(\xi, \tau) d\tau$.

Note that, under our growth condition on f , the functional $\mathcal{J}_\lambda \in C^1(S_0^1(D))$ and its derivative at $u \in S_0^1(D)$ is given by

$$\langle \mathcal{J}'_\lambda(u), \varphi \rangle = \int_D \langle \nabla_{\mathbb{G}} u(\xi), \nabla_{\mathbb{G}} \varphi(\xi) \rangle d\xi - \lambda \int_D f(\xi, u(\xi)) \varphi(\xi) d\xi,$$

for every $\varphi \in S_0^1(D)$.

Thus the weak solutions of problem (P_λ^f) are exactly the critical points of the energy functional $\mathcal{J}_\lambda$.

Fix $\lambda > 0$ and denote

$$\Phi(u) := \|u\|_{S_0^1(D)}^2 \quad \text{and} \quad \Psi_\lambda(u) := \lambda \int_D F(\xi, u(\xi)) d\xi,$$

for every $u \in S_0^1(D)$.

Note that, thanks to condition (6), the operator Ψ is well defined and sequentially weakly (upper) continuous. So the operator $\mathcal{J}_\lambda$ is sequentially weakly lower semicontinuous on $S_0^1(D)$. With the above notations we can prove the next two lemmas that will be crucial in the sequel.

Lemma 3.2. *Let $\lambda > 0$ and suppose that*

$$(9) \quad \limsup_{\varepsilon \rightarrow 0^+} \frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \varrho_0 - \varepsilon])} \Psi_\lambda(v)}{\varepsilon} < \varrho_0,$$

for some $\varrho_0 > 0$. Then

$$(10) \quad \inf_{\sigma < \varrho_0} \frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \sigma])} \Psi_\lambda(v)}{\varrho_0^2 - \sigma^2} < \frac{1}{2}.$$

Proof. First, by condition (9) one has

$$(11) \quad \limsup_{\varepsilon \rightarrow 0^+} \frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \varrho_0 - \varepsilon])} \Psi_\lambda(v)}{\varrho_0^2 - (\varrho_0 - \varepsilon)^2} < \frac{1}{2}.$$

Indeed, if $\varepsilon \in (0, \varrho_0)$, one has

$$\begin{aligned} & \frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \varrho_0 - \varepsilon])} \Psi_\lambda(v)}{\varrho_0^2 - (\varrho_0 - \varepsilon)^2} \\ &= \frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \varrho_0 - \varepsilon])} \Psi_\lambda(v)}{\varepsilon} \times \\ & \quad \times \frac{-\varepsilon/\varrho_0}{\varrho_0 \left[\left(1 - \frac{\varepsilon}{\varrho_0} \right)^2 - 1 \right]}, \end{aligned}$$

and

$$\lim_{\varepsilon \rightarrow 0^+} \frac{-\varepsilon/\varrho_0}{\varrho_0 \left[\left(1 - \frac{\varepsilon}{\varrho_0} \right)^2 - 1 \right]} = \frac{1}{2\varrho_0}.$$

Now, by (11) there exists $\bar{\varepsilon} > 0$ such that

$$\frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \varrho_0 - \varepsilon])} \Psi_\lambda(v)}{\varrho_0^2 - (\varrho_0 - \varepsilon)^2} < \frac{1}{2},$$

for every $\varepsilon \in]0, \bar{\varepsilon}[$. Setting $\sigma_0 := \varrho_0 - \varepsilon_0$ (with $\varepsilon_0 \in]0, \bar{\varepsilon}[$), it follows that

$$\frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \sigma_0])} \Psi_\lambda(v)}{\varrho_0^2 - \sigma_0^2} < \frac{1}{2},$$

and thus inequality (10) is verified. $\square$

Lemma 3.3. *Let $\lambda > 0$ and suppose that condition (10) holds. Then*

$$(12) \quad \inf_{u \in \Phi^{-1}([0, \varrho_0])} \frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \Psi_\lambda(u)}{\varrho_0^2 - \|u\|_{S_0^1(D)}^2} < \frac{1}{2}.$$

Proof. Assumption (10) yields

$$(13) \quad \sup_{v \in \Phi^{-1}([0, \sigma_0])} \Psi_\lambda(v) > \sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \frac{1}{2}(\varrho_0^2 - \sigma_0^2),$$

for some $0 < \sigma_0 < \varrho_0$. Thanks to the weakly regularity of the functional Ψ_λ , since

$$\sup_{v \in \Phi^{-1}([0, \sigma_0])} \Psi_\lambda(v) = \sup_{\|v\|_{S_0^1(D)} = \sigma_0} \Psi_\lambda(v),$$

by (13) there exists $u_0 \in S_0^1(D)$ with $\|u_0\|_{S_0^1(D)} = \sigma_0$ such that

$$(14) \quad \Psi_\lambda(u_0) > \sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \frac{1}{2}(\varrho_0^2 - \sigma_0^2),$$

that is,

$$(15) \quad \frac{\sup_{v \in \Phi^{-1}([0, \varrho_0])} \Psi_\lambda(v) - \Psi_\lambda(u_0)}{\varrho_0^2 - \|u_0\|_{S_0^1(D)}^2} < \frac{1}{2},$$

with $\|u_0\|_{S_0^1(D)} = \sigma_0$. The proof is now complete. $\square$

4. PROOF OF THEOREM 3.1

For the proof of our main result, we first note that problem (P_λ^f) has a variational structure. Indeed, it is the Euler-Lagrange equation of the functional $\mathcal{J}_\lambda$.

Hence, fix

$$(16) \quad \lambda \in \left(0, \frac{(p-1)^{\frac{p-1}{p}}}{p \kappa_{1,\gamma}^{\frac{p-1}{p}} \kappa_{2,\gamma}^{\frac{p+1}{p}} \|\alpha\|_{L^{\frac{\gamma 2^*}{\gamma 2^*-1}}(D)}^{\frac{p-1}{p}} \|\beta\|_{L^{\frac{1}{1-\gamma}}(D)}^{\frac{1}{p}}} \right),$$

and let us consider $0 < \varepsilon < \varrho$. Setting

$$\Lambda_\lambda(\varepsilon, \varrho) := \frac{\sup_{v \in \Phi^{-1}([0, \varrho])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \varrho-\varepsilon])} \Psi_\lambda(v)}{\varepsilon},$$

one has

$$\Lambda_\lambda(\varepsilon, \varrho) \leq \frac{1}{\varepsilon} \left| \sup_{v \in \Phi^{-1}([0, \varrho])} \Psi_\lambda(v) - \sup_{v \in \Phi^{-1}([0, \varrho-\varepsilon])} \Psi_\lambda(v) \right|.$$

Moreover, it follows that

$$\Lambda_\lambda(\varepsilon, \varrho) \leq \sup_{v \in \Phi^{-1}([0, 1])} \int_D \left| \int_{(\varrho-\varepsilon)v(\xi)}^{\varrho v(\xi)} \lambda \frac{|f(\xi, t)|}{\varepsilon} dt \right| d\xi.$$

Now the growth condition (6) yields

$$\begin{aligned} \sup_{v \in \Phi^{-1}([0, 1])} \int_D \left| \int_{(\varrho-\varepsilon)v(\xi)}^{\varrho v(\xi)} \lambda \frac{|f(\xi, t)|}{\varepsilon} dt \right| d\xi &\leq \sup_{v \in \Phi^{-1}([0, 1])} \int_D \lambda \alpha(\xi) |v(\xi)| d\xi \\ &+ \sup_{v \in \Phi^{-1}([0, 1])} \int_D \frac{\lambda \beta(\xi)}{p+1} \left(\frac{\varrho^{p+1} - (\varrho-\varepsilon)^{p+1}}{\varepsilon} \right) |v(\xi)|^{p+1} d\xi. \end{aligned}$$

Since the Folland-Stein space $S_0^1(D)$ is compactly embedded in $L^q(D)$, for every $q \in [1, 2^*)$, bearing in mind that

$$\lambda\alpha \in L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D) \quad \text{and} \quad \lambda\beta \in L^{\frac{1}{1-\gamma}}(D),$$

the above inequality yields

$$\Lambda_\lambda(\varepsilon, \varrho) \leq \kappa_{1,\gamma} \|\lambda\alpha\|_{L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D)} + \frac{\kappa_{2,\gamma}^{p+1}}{p+1} \|\lambda\beta\|_{L^{\frac{1}{1-\gamma}}(D)} \left(\frac{\varrho^{p+1} - (\varrho - \varepsilon)^{p+1}}{\varepsilon} \right).$$

Thus passing to the limsup, as $\varepsilon \rightarrow 0^+$, we get

$$(17) \quad \limsup_{\varepsilon \rightarrow 0^+} \Lambda_\lambda(\varepsilon, \varrho) < \kappa_{1,\gamma} \|\lambda\alpha\|_{L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D)} + \kappa_{2,\gamma}^{p+1} \|\lambda\beta\|_{L^{\frac{1}{1-\gamma}}(D)} \varrho^p.$$

Now, consider the real function

$$\varphi_\lambda(\varrho) := \kappa_{1,\gamma} \|\lambda\alpha\|_{L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D)} + \kappa_{2,\gamma}^{p+1} \|\lambda\beta\|_{L^{\frac{1}{1-\gamma}}(D)} \varrho^p - \varrho,$$

for every $\varrho > 0$.

It is easy to see that $\inf_{\varrho > 0} \varphi_\lambda(\varrho)$ is attained at

$$\varrho_{0,\lambda} := \left(\lambda p \kappa_{2,\gamma}^{p+1} \|\beta\|_{L^{\frac{1}{1-\gamma}}(D)} \right)^{\frac{1}{1-p}}.$$

and, by (16), one has

$$\inf_{\varrho > 0} \varphi_\lambda(\varrho) < 0.$$

Hence inequality (17) yields

$$\limsup_{\varepsilon \rightarrow 0^+} \Lambda_\lambda(\varepsilon, \varrho) < \varrho_{0,\lambda}.$$

Now, it follows by Lemmas 3.2 and 3.3 that

$$\inf_{u \in \Phi^{-1}([0, \varrho_{0,\lambda}])} \frac{\sup_{v \in \Phi^{-1}([0, \varrho_{0,\lambda}])} \Psi_\lambda(v) - \Psi_\lambda(u)}{\varrho_{0,\lambda}^2 - \|u\|_{S_0^1(D)}^2} < \frac{1}{2}.$$

The above relation implies that there exists $w_\lambda \in S_0^1(D)$ such that

$$\Psi_\lambda(u) \leq \sup_{v \in \Phi^{-1}([0, \varrho_{0,\lambda}])} \Psi_\lambda(v) < \Psi_\lambda(w_\lambda) + \frac{1}{2}(\varrho_{0,\lambda}^2 - \|w_\lambda\|_{S_0^1(D)}^2),$$

for every $u \in \Phi^{-1}([0, \varrho_{0,\lambda}])$.

Thus

$$(18) \quad \mathcal{J}_\lambda(w_\lambda) := \frac{1}{2} \|w_\lambda\|_{S_0^1(D)}^2 - \Psi_\lambda(w_\lambda) < \frac{\varrho_{0,\lambda}^2}{2} - \Psi_\lambda(u),$$

for every $u \in \Phi^{-1}([0, \varrho_{0,\lambda}])$.

Since the energy functional $\mathcal{J}_\lambda$ is sequentially weakly lower semicontinuous, its restriction on $\Phi^{-1}([0, \varrho_{0,\lambda}])$ has a global minimum $u_{0,\lambda} \in \Phi^{-1}([0, \varrho_{0,\lambda}])$.

Note that $u_{0,\lambda}$ belongs to $\Phi^{-1}([0, \varrho_{0,\lambda}))$. Indeed, if $\|u_{0,\lambda}\|_{S_0^1(D)} = \varrho_{0,\lambda}$, by (18), one has

$$\mathcal{J}_\lambda(u_{0,\lambda}) = \frac{\varrho_{0,\lambda}^2}{2} - \Psi_\lambda(u_{0,\lambda}) > \mathcal{J}_\lambda(w_\lambda),$$

which is a contradiction.

In conclusion, it follows that $u_{0,\lambda} \in S_0^1(D)$ is a local minimum for the energy functional $\mathcal{J}_\lambda$ with

$$\|u_{0,\lambda}\|_{S_0^1(D)} < \varrho_{0,\lambda},$$

hence in particular, a weak solution of problem (P_λ^f) . This completes the proof.

Remark 4.1. A crucial step in our approach is the explicit computation of the embedding constants $\kappa_{i,\gamma}$ that naturally appear in Theorem 3.1 and its consequences. In the special case of the Heisenberg group $\mathbb{H}^n$ an explicit expression of these quantities can be obtained by using the best constant in the Sobolev inequality

$$(19) \quad \int_D |u(\xi)|^{2_h^*} d\xi \leq C \int_D |\nabla_{\mathbb{H}^n} u(\xi)|^2 d\xi, \quad \forall u \in C_0^\infty(D)$$

that was determined by Jerison and Lee in [9, Corollary C].

Remark 4.2. It is clear that Theorem 1.1 is a simple consequence of Theorem 3.1. Indeed, preserving our notations and assuming that

$$0 < \kappa < \frac{(p-1)^{\frac{p-1}{p}}}{pc_{1,\gamma}^{\frac{p-1}{p}} c_{2,\gamma}^{\frac{p-1}{p}}} |D|^{\frac{1-\gamma}{p} + \frac{(1-p)(\gamma 2_h^* - 1)}{p\gamma 2_h^*}},$$

it is easy to note that

$$\frac{(p-1)^{\frac{p-1}{p}}}{pc_{1,\gamma}^{\frac{p-1}{p}} c_{2,\gamma}^{\frac{p-1}{p}} \|\kappa\|_{L^{\frac{1}{\gamma 2_h^* - 1}}(D)}^{\frac{p-1}{p}} \|\kappa\|_{L^{\frac{1}{1-\gamma}}(D)}^{\frac{1}{p}}} > 1.$$

Since all the assumptions of Theorem 3.1 have been verified (with $\lambda = 1$) the conclusion of Theorem 1.1 immediately follows.

A special case of Theorem 3.1 reads as follows.

Corollary 4.3. *Let D be a smooth and bounded domain of the Carnot group $\mathbb{G}$ of homogeneous dimension $\dim_h \mathbb{G} \geq 3$ and let $f : D \times \mathbb{R} \rightarrow \mathbb{R}$ be a Carathéodory function such that condition (6) holds. Assume that*

$$(20) \quad \|\alpha\|_{L^{\frac{p-1}{\gamma 2_h^* - 1}}(D)}^{p-1} \|\beta\|_{L^{\frac{1}{1-\gamma}}(D)} < \frac{(p-1)^{p-1}}{p\kappa_{1,\gamma}^{p-1} \kappa_{2,\gamma}^{p+1}}.$$

Then the following subelliptic problem

$$(P_f) \quad \begin{cases} -\Delta_{\mathbb{G}} u = f(\xi, u) & \text{in } D \\ u|_{\partial D} = 0, \end{cases}$$

has a weak solution $u_0 \in S_0^1(D)$ and

$$\|u_0\|_{S_0^1(D)} < \left(p\kappa_{2,\gamma}^{p+1} \|\beta\|_{L^{\frac{1}{1-\gamma}}(D)} \right)^{\frac{1}{1-p}}.$$

Remark 4.4. A special case of Corollary 4.3 in the Euclidean setting has been proved in [1] by exploiting the variational principle obtained by Ricceri in [18].

In conclusion, we present a direct application of our main result.

Example 4.5. Let D be a smooth and bounded domain of a Carnot group $\mathbb{G}$ with $\dim_h \mathbb{G} \geq 3$ and let

$$\alpha \in L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D) \setminus \{0\},$$

with $\gamma \in (2/2^*, 1)$.

By virtue of Theorem 3.1, there exists an open interval $\Lambda \subset (0, +\infty)$ such that for every $\lambda \in \Lambda$, the following problem

$$\begin{cases} -\Delta_{\mathbb{G}} u = \lambda(\alpha(\xi) + |u|^p) & \text{in } D \\ u|_{\partial D} = 0, \end{cases}$$

where $p \in (1, \gamma 2^* - 1)$, admits at least one non-trivial weak solution $u_{0,\lambda} \in S_0^1(D)$ such that

$$\|u_{0,\lambda}\|_{S_0^1(D)} < \left(\lambda p \kappa_{2,\gamma}^{p+1} |D|^{1-\gamma} \right)^{\frac{1}{1-p}}.$$

More precisely, a concrete expression of the interval Λ is given by

$$\Lambda := \left(0, \frac{(p-1)^{\frac{p-1}{p}} |D|^{\frac{\gamma-1}{p}}}{p \kappa_{1,\gamma}^{\frac{p}{p-1}} \kappa_{2,\gamma}^{\frac{p}{p-1}} \|\alpha\|_{L^{\frac{\gamma 2^*}{\gamma 2^* - 1}}(D)}^{\frac{p}{p-1}}} \right).$$
